Heatmap showing the coefficient of the first principal component (PC1) for different lags of the time series. The x-axis represents the lag τ (days), ranging from 1 to 30. The y-axis represents the coefficient of PC1, ranging from 0.001 to 0.005. The color scale indicates the magnitude of the coefficient, with yellow representing higher values and dark purple representing lower values.

The figure displays four heatmaps arranged vertically, each representing a different atmospheric forcing variable: PRCP (top), SRAD, Tair, and VP (bottom). The x-axis for all plots is 'Lag τ (days)' ranging from 0 to 30. The y-axis labels are positioned to the left of their respective rows. A color bar on the right indicates the 'Significant TE (nats)' scale, ranging from approximately 0.001 (dark purple) to 0.010 (yellow).

Lag τ (days)																															

Heatmap of the cross-correlation function (CCF) for the residuals of the fitted model. The x-axis represents the lag τ in days, ranging from 1 to 30. The y-axis represents the CCF value, ranging from 0.0000 to 0.0028. The plot shows a significant positive correlation at lag 1 (0.0028) and a significant negative correlation at lag 23 (0.0006). Other lags are mostly within the confidence interval.

Heatmap showing the TE (nats) for four atmospheric forcing variables (PRCP, SRAD, Tair, VP) across 30 lag days. The color scale ranges from 0.0005 (dark purple) to 0.0035 (yellow). PRCP shows a significant peak at lag 1 (0.0037). SRAD, Tair, and VP show more moderate values, with Tair having a peak at lag 12 (0.0018).

Heatmap showing the Time Efficacy (TE) for four atmospheric forcing variables (PRCP, SRAD, Tair, VP) across 30 lag days. The color scale ranges from 0.001 (dark purple) to 0.006 (yellow). PRCP shows the highest TE values, peaking at 0.0061 at lag 3. SRAD, Tair, and VP show lower TE values, generally below 0.003.

The heatmap displays the Significant Transfer Entropy (TE) in nats as a function of the lag τ in days for four different atmospheric forcing variables. The color scale ranges from approximately 0.0003 (dark purple) to 0.0016 (yellow). The x-axis represents the lag τ from 1 to 30 days, and the y-axis lists the forcing variables: PRCP, SRAD, Tair, and VP.

Forcing Variable	Lag τ (days)	Significant TE (nats)
PRCP	1	0.0013
	2	0.0008
	6	0.0008
	12	0.0011
SRAD	27	0.0013
	28	0.0013
Tair	7	0.0014
VP	1	0.0016

Heatmap showing the correlation between four climate indices (PRCP, SRAD, lair, VP) and a lag of 30 days. The color scale ranges from 0.00025 (dark purple) to 0.00225 (yellow). PRCP shows a strong positive correlation at lag 1 (yellow, 0.0023). SRAD, lair, and VP show much weaker correlations, generally below 0.001.

The figure displays a 4x30 grid of TF matrix values. The rows represent different atmospheric forcing variables: PRCP, SRAD, Tair, and VP. The columns represent lags from 1 to 30 days. The color intensity indicates the magnitude of the TF value, with a color bar on the right ranging from 0.0002 to 0.0014.

	Lag 1	Lag 2	Lag 3	Lag 4	Lag 5	Lag 6	Lag 7	Lag 8	Lag 9	Lag 10	Lag 11	Lag 12	Lag 13	Lag 14	Lag 15	Lag 16	Lag 17	Lag 18	Lag 19	Lag 20	Lag 21	Lag 22	Lag 23	Lag 24	Lag 25	Lag 26	Lag 27	Lag 28	Lag 29	Lag 30

Heatmap showing TE (nats) for four atmospheric forcing types (PRCP, SRAD, Tair, VP) across 30 lag days. The color scale ranges from 0.001 (dark purple) to 0.007 (yellow). PRCP shows the highest TE values, peaking at 0.0079 at lag 1. SRAD peaks at 0.0060 at lag 1. Tair and VP show lower TE values, generally below 0.0035.

The heatmap displays the correlation values for four variables (PRCP, SRAD, Tair, VP) across 30 lag days. The color intensity represents the correlation magnitude, with a scale from 0.002 to 0.016.
